

# Building analytics, orchestrated end to end.

A LangGraph multi-agent system turns a natural-language question into a **validated, reproducible building-energy analysis**—across distributed domain tools.

## AGENTIC WORKFLOW — FIVE SPECIALIZED AGENTS, REQUEST TO VALIDATED RESULT

### Shared blackboard state keeps every agent aligned.

Request context, semantic mappings, quality evidence, transformations and results remain traceable through the workflow.

### Plug-and-play

Declarative YAML specifications define data contracts; MCP connects independently deployed analytics tools.

#### Pilot · Energy benchmarking

Raw monthly utility bills → automated unit conversion → validated BETTER/BPD benchmark, from one natural-language request.

#### Pilot · AHU fault detection

Heterogeneous sensor files → semantic column mapping → whole-building HVAC diagnostics with interpreted findings.

**Agent of the Week**  
Common Agentic Framework  
DOE Genesis ModCon

## Designed for real building workflows

- 01 Scientific reach**  
Energy benchmarking, fault diagnostics, forecasting and cross-domain analysis.
- 02 Data-aware reasoning**  
Semantic discovery, explicit quality gates and adaptive preparation before execution.
- 03 Composable by design**  
New algorithms and MCP servers can be introduced without rebuilding the orchestration layer.
